

Hurricane Force Winds in Wisconsin 1970-2007

This 38-year climatology for the state of Wisconsin consists of **thunderstorm-related** winds events of 75 mph or greater as documented in the *Storm Data* publication. It is worth noting that *Storm Data* lists numerous severe wind events over the years without an estimate or measurement of wind speed and are thus not included in this climatology. Also, when the same storm event registered high winds in neighboring counties, each county is accounted for, however, the few times that multiple winds at or above 75 mph were reported in the same county from the same event, only the highest wind was included in the report. All winds at or above 100 mph were included in this study. Consider each entry below a “county wind event” for the bean-counts.

Hurricane-force winds are defined as sustained winds of 74 mph or higher. In the past 38 years, Wisconsin has experienced winds of 75 mph or higher on 197 days, or about 5.2 days per year on average. The only year this didn’t happen was in 1978. A total of 495 hurricane-force “county wind events” have been documented. This results in an average of 13.2 county wind events occur per year (hurricane-force thunderstorm winds).

Thunderstorm wind gusts of 100+ mph, similar to those of a Category 2 Hurricane, occurred in 16 years of the 38-year study, or about once every 2.8 years. A total of 59 county 100+ mph hurricane-force wind events occurred during the period of 1970-2007, for an average of 1.6 events per year, or alternatively, 3.9 events occurred in Wisconsin for those years that did have 100+ mph hurricane-force thunderstorm wind gusts. It is noteworthy that many of these events occurred on the same calendar day.

In many cases, the peak wind gust values are estimates, and in others it is a measured value.
